Econ 629  
Econometrics II  
Professor Tim Halliday  
Class Time: TTh 9:00-10:15  
Office Hours: By Appointment

Course Description:

This is the second part of the first-year graduate econometrics sequence at UH-Manoa. The course will cover four main topics: linear systems of equations, general M-estimation theory, specific examples of non-linear estimation (e.g. discrete choice, tobit, and selection models), and econometric issues in survey data. There will be 4 to 5 problem sets and I am hoping that one will be empirical. There will be one midterm exam sometime in October and a final.

Texts:

Lecture notes are also available on Laulima.

Course Requirements:

The requirements of this course are 4-5 problem sets, a midterm exam and a final exam. Your grade will be determined by the following formula:

<table>
<thead>
<tr>
<th>Component</th>
<th>Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Problem Sets</td>
<td>1/3</td>
</tr>
<tr>
<td>Midterm + Final</td>
<td>2/3</td>
</tr>
</tbody>
</table>

The highest score among the midterm and final will be weighted 2/3 and the lowest will be weighted 1/3.
Outline (Tentative):

NOTE ALL TOPICS ARE CONTAINED IN MY LECTURE NOTES

Review of Gauss-Markov and Aitken’s Theorem (Lecture Notes)

Panel Data (Lecture Notes)

   Fixed Effects Estimation; Generalized Least Squares; Maximum Likelihood

Linear Systems of Equations (Wooldridge: Ch 7-9, Amemiya: Ch 6-7)

   System Ordinary Least Squares; Generalized Least Squares; Seemingly Unrelated Regression; Generalized Method of Moments; Three-Stage Least Squares; Overidentification Tests; Simultaneous Equations

Non-linear Models (Wooldridge: Ch 15-16, Amemiya: Ch 9-10)

   Linear Probability Models; Probits, Logits; Dynamic Binary Choice Models; Multinomial Choice Models; Ordered Choice Models; Censored Regression Models; Selection Models

Treatment Effects (W: Ch 18, Lecture Notes)

   Average Treatment Effects, Propensity Scores, Balancing Scores, Selection on Observables, Local Average Treatment Effects

M-Estimation (Wooldridge: Ch 12-14, Amemiya: Ch 3-4)

   Identification; Consistency; Asymptotic Normality; Two-step Estimators; Variance Estimation; Testing; Optimization Methods; Simulation and Re-Sampling Methods; Maximum Likelihood; General Treatment of GMM

Issues in Survey Data (Deaton: Ch 1-2)

   Descriptive Statistics; Weighting; Stratification; Clustering; Bootstrapping; Heteroskedasticity; Quantile Regression; Panel Data; Instrumental Variables and Natural Experiments; Repeated Cross Sections; Sample Size and Hypothesis Testing
